1. TANGATION: Carboxypeptidase which converts angiotensin I to angiotensin 1-9, a peptide of unknown function, and angiotensin II to angiotensin 1-7, a vasodilator. Also able to hydrolyze apelincin and dynorphin-13 with high efficiency. May be an important regulator of heart function (By similarity). Functional receptor for human coronavirus SARS.

1. COFACTOR: Binds 1 zinc ion per subunit (By similarity).

2. SUBURILIT: Interacts with HCOV-SARS S protein.

3. SUBURILITY: Recacts with HCOV-SARS S protein.

4. SUBURILITY: Belongs to the peptidase M2 family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -I-FUNCTION: Carboxypeptidase which converts angiotensin I to angiotensin 1-9, a peptide of unknown function, and angiotensin 11-9, a vasodilator. Also able to hydrolyze apelin-13 and dynorphin-13 with high efficiency. May be an important regulator of heart function.

-I-COFACTOR: Binds I zinc ion per subunit (By similarity).
-I-COFACTOR: Binds I chloride ion per subunit (By similarity).
-I-ENZYME REGULATION: Activated by chloride and fluoride, but not bromide: Inhibited by MIN-4760, CFP Leu, and BDTA, but not by the bromide: Inhibited by MIN-4760, CFP Leu, and BDTA, but not by the ACE inhibitors linosipril, captopril, enalaprilat.
-I-SUBCELLULAR LOCATION: Type I membrane protein. Processing by ADAM17 may lead to a secreted protein (By similarity).
-I-TISSUE SPECIFICITY: Expressed in heart, kidney and forebrain. In testis, expressed in endothelial cells from small and large arteries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This Swiss-Prot entry is copyright. INDUCTION: Down-regulated in lung after acute injury.

INSCELLANEOUS: Mice lacking ACES are viable and fertile, exhibit normal kidney and lung function, but show a severe reduction in cardiac contractility, and are highly sensitive to severe acute lung failure. Transgenic mice overexpressing ACES in the heart appear healthy but show conduction disturbances and ventricular arrhythmias which can lead to sudden death.

CAUTION: Ref. I. (BAB40431) sequence differs from that shown due to a frameshift in position 784.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sarao R.,

--- TISSUE SPECIFICITY: Spermatocytes, adult testis.
--- INUUCTION: Expression is thought to be subject to hormonal regulation by androgens.
--- FTM: Phosphorylated by CK2 on Ser-725; which allows membrane retention (By similarity).
--- MISCELIANBOUS: The glycosidase activity probably uses different active side side residues than the metalloprotease activity.
--- MISCELIANBOUS: Inhibitors of ACE are commonly used to treat hypertension and cardiac dysfunction.
--- SIMILARITY: Belongs to the peptidase M2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiotensin-converting enzyme, testis-
specific isoform.
Angiotensin-converting enzyme, testis-
specific isoform, soluble form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (complex).

The structural details on the binding of antihypercensive drugs captopril

and enalaprilat to human testicular angiotensin I-converting enzyme.";

Biochemistry 43:8718-8724(2004).

I FUNCTION: Converts angiotensin I to angiotensin II by release of the terminal His-Leu, this results in an increase of the vasoconstrictor activity of angiotensin. Also able to inactivate bradykinin, a potent vasodilator. Has also a glycosidase activity which releases GPI-anchored proteins from the membrane by cleaving the mannose linkage in the GPI modsty.

C.I. CAPTALYTIC ACTIVITY: Release of a C-terminal dipeptide,

C.I. CAPTALYTIC ACTIVITY: Release of a C-terminal dipeptide of angiotensin I to angiotensin II, with increase in vasoconstrictor activity, but no action on

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Which increases and the state of the subunit.
-!- COPACTOR: Binds 1 zinc ion per subunit.
-!- COPACTOR: Binds 2 chloride ions per subunit.
-!- ENZYME REGULATION: Strongly activated by chloride. Specifically in the strongly activated by chloride.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KM=2.7 mM for Hip-His-Leu; SUBCELLULAR LOCATION: Type I membrane protein. A soluble form released by proteolysis also exists.

-!- FUNCTION: Converts angiotensin I to angiotensin II by release of the terminal His-Leu, this results in an increase of the vasconstrictor activity of angiotensin. Also able to inactivate bradykinin, a potent vasodilator.

-!- CATALVIIC ACTIVITY: Release of a C-terminal dipeptide, oligopeptide-|-Xaa-Yaa, when Xaa is not Pro, and Yaa is neither Asp nor glu Thus, conversion of angiotensin I to angiotensin II.

with increase in vasoconstrictor activity, but no action on angiotensin II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isold=P12821-1; Sequence=Displayed;

-!- MISCELLANBOUS: Inhibitors of ACE are commonly used to treat hypertension and some types of renal and cardiac dysfunction.
-!- SIMILARITY: Belongs to the peptidase M2 family.
                                                [15]

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the terminal His-Leu, this results in an increase of the vasoconstrictor activity of angiotensin. Also able to inactivate bradykinin, a potent vasodilator. Has also a glycosidase activity which releases GPI-anchored proteins from the membrane by cleaving the mannose linkage in the GPI molety. This GPI as a ctivity seems to be crucial for the egg-binding ability of the sperm. CATALYTIC ACTIVITY: Release of a C-terminal dipeptide, oligopeptide, avaisable with increase in vasoconstrictor activity, but no action on with increase in vasoconstrictor activity, but no action on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1- MISCELLANEOUS: Mice lacking ACE have low blood pressure, elevated gerum potassium, anemia, and renal defects. Male mice have reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δ

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

COFACTOR: Binds 2 chloride ions per subunit (By similarity).

COFACTOR: Binds 2 chloride ions per subunit (By similarity).

ENDYME RECULATION: Peptidase activity is specifically inhibited lisinopril, captopril and enalaprilat. In contrast, GPIase activity is nearly insensitive to captopril.

SUBCELLULAR LOCATION: Type I membrane protein. A soluble form released by proteolysis also exists (By similarity).
